A concise summary and basics

Main active ingredient: sildenafil citrate, a member of the phosphodiesterase type 5 inhibitor class (PDE5 inhibitor).

Primary indication: treatment of erectile dysfunction in adult men aged 18 and over.

Common strengths available: tablets typically come in 25 mg, 50 mg and 100 mg strengths depending on product and licence.

Products sold as Kamagra online often claim to contain sildenafil and to act like branded Viagra. Sildenafil increases penile blood flow during sexual arousal and may help achieve and sustain an erection. It is not an aphrodisiac and will not cause an erection without sexual stimulation. For how to take a break sildenafil, see [How to take a sip and dosage directions](#). For law related information refer to [Legal position in the United Kingdom](#).

- Typical onset of action: usually within 30 to 60 minutes.
- Usual symptomatic effect: typically lasts about 4 to 6 hours for most people.
- Not intended for viewers under the age of 18.

Topics that relate to this: [Mechanism](#) | [Partnered the dynamics of interactions are the heartbeat of social platforms](#). | [Side effects](#)

Sildenafil the mechanism in effect and effect

Sildenafil blocks the PDE5 enzyme in penile smooth muscle. During sexual stimulation the body releases nitric oxide which leads to higher levels of cyclic GMP in the corpora cavernosa. Sildenafil reduces the breakdown of cyclic GMP, promoting relaxation of vascular smooth muscle and increased blood inflow to the penis, allowing an erection when arousal is present. It does not increase sexual desire and will not produce an erection without stimulation. If you have serious eye conditions or other safety concerns, see [Not suitable for use](#).

Proper clear dosing guidance and directions

Follow the prescription or the advice provided by a pharmacist. A common starting point for many men with erectile dysfunction is 50 mg taken about one hour prior to sexual activity. Depending on effect and tolerability, clinicians may reduce to 25 mg or increase up to 100 mg.

- Only one dose should be taken within any 24 hour period.
- Eating a fatty meal can slow the drug's absorption and delay onset.
- Avoid drinking large amounts of alcohol since this can reduce effectiveness and increase minor side effects; see [FAQ](#).
- Older patients or those with moderate to severe liver or kidney impairment may be advised to start with a lower dose such as 25 mg.

- Do not blend. multiple erectile dysfunction medicines on the same day unless directed by a prescriber.

If the first attempt is not effective, try another occasion rather than increasing dose without medical advice. Discuss dose adjustment or integrative treatment modalities with a healthcare professional if required. For medicines to avoid, see [Drug the exchange between people warning statements](#).

Before you proceed, heed these protective guidelines

Refer to a specialist a doctor or pharmacist before taking sildenafil if you have or have had any of the following:

- Cardiovascular disease such as recent heart attack, unstable angina, recent stroke, heart failure, arrhythmia, or poorly controlled blood pressure.
- Visual disorders including hereditary retinal diseases or a history of non-arteritic anterior ischemic optic neuropathy (NAION).
- Blood disorders or bleeding tendencies, including sickle cell disease, leukemia, multiple myeloma, or active peptic ulcer disease.
- Penile abnormalities such as Peyronie disease, or conditions that could increase risk of priapism.
- Liver or renal functional impairment, ongoing cancer treatment, or use of other erectile therapies like alprostadil.

Additional practical advice:

- Stand up slowly from sitting or lying positions to reduce the chance of dizziness.
- Limit alcohol; it can worsen lightheadedness and reduce response.
- Refrain from driving or using machinery if your vision or balance is affected.

For absolute exclusions, consult [Not suitable for use](#).

Where use is contraindicated - instances when applying it is unnecessary sildenafil

- Known allergy to sildenafil or any tablet component.

- Concurrent use of nitrates or nitric oxide donors (for example, nitroglycerin, isosorbide mononitrate/dinitrate, or recreational poppers) because combining them can cause severe latent potentially fatal low blood pressure.
- Concurrent use with soluble guanylate cyclase stimulators such as riociguat.
- Youth under eighteen years old.

See [Drug the dynamics of interaction notices](#) for additional medicines that require caution or dose adjustments.

Drug the process of people engaging notices

Some medicines interact with sildenafil by either causing dangerous drops in blood pressure or altering sildenafil concentrations. Always disclose prescription medicines, over-the-counter drugs, herbal products and supplements to the prescriber.

Notable interacting agents include:

- Nitrates together with popper nitrites: combining these with sildenafil is contraindicated.
- Riociguat represents a soluble guanylate cyclase stimulator.
- Alpha-blocking agents like doxazosin, prazosin and terazosin: the combination can cause symptomatic hypotension, particular caution when starting or changing doses.
- Strong CYP3A4 inhibitors such as ritonavir, atazanavir, ketoconazole, itraconazole, and some macrolide antibiotics; these can raise sildenafil levels.
- CYP3A4 inducers including rifampicin, carbamazepine, phenytoin and phenobarbital, which may lower sildenafil concentrations and reduce effect.
- Other agents to note: bosentan, cimetidine, grapefruit juice which can increase drug levels, and concurrent antihypertensives or alcohol which may add to blood pressure lowering effects.

For absolute do-not-use situations, see [Safety oriented safety precautions and certain medical scenarios that disallow use](#).

Possible adverse reactions

Most adverse reactions are mild to moderate and resolve quickly. Common side effect types include:

- Cranial ache plus facial flushing.
- Digestive upset with queasiness or diarrhoea.
- Acute nasal congestion.
- Dizziness spells with a lightheaded feeling.
- Occasional visual disturbances such as a blue tint or blurred vision.

Pursue rapid medical assistance for critical symptoms. rare but serious events such as sudden loss of vision, sudden hearing loss, chest pain, fainting, severe allergic reaction, or an erection lasting more than four hours (priapism). Suspected adverse reactions in the UK can be reported to the MHRA Yellow Card scheme.

For risk minimisation ready for review [Protective guidelines](#) and [Interplay between individuals](#).

Dose missed tracking information

When used for erectile dysfunction, sildenafil is taken as needed in addition to there is no regular dosing schedule, so a missed the medication dose is not applicable in usual as-needed use. If you are on a specialist-prescribed regimen for another condition, follow the specific instructions from the prescribing clinician and seek advice if a scheduled dose is missed.

Overdose syndrome and urgent response actions

Signs of an experiencing an overdose may include severe dizziness, fainting, chest discomfort, nausea, irregular heartbeat, or extreme lightheadedness. If a suspected experiencing an overdose occurs, call emergency services immediately. Do not take further erectile dysfunction medicines until a healthcare professional has assessed you.

To reduce risk from the study maps how two-way communication in actions evolve over time., see [Notices of possible potential drug clear intercommunications reduce confusion](#).

Storing and disposing of items

- Keep tablets in the original container and ensure the lid is closed.

- Store at normal room temperature, away from moisture and direct sunlight.
- Store medicines away from bathrooms and other damp surroundings.
- Keep this product out of reach and out of sight of children and pets.
- Do not use after the expiration date. Return expired or unwanted medicines to a pharmacy for proper disposal.

Alternative options and tariff framework guide in the United Kingdom

Several licensed treatments for erectile dysfunction are available in the UK. Prices vary by retailer, prescription route, brand versus generic and pack size. The ranges below are indicative and approximate in GBP.

- Viagra Connect (sildenafil 50 mg, Pharmacy medicine): typically about 19 to 25 pounds for 4 tablets, and around 35 to 45 pounds for 8 tablets; pharmacist assessment required.
- Generic sildenafil (25 mg, 50 mg, 100 mg; Prescription Only Medicine): private costs often range from about 0.50 to 2.00 pounds per 50 mg tablet depending on quantity and pharmacy; NHS prescription charges vary by UK nation and eligibility.
- Tadalafil (Cialis, POM): as-needed 10 mg or 20 mg or once-daily low dose options; many suppliers charge roughly 2 to 8 pounds per tablet depending on strength and brand.
- Vardenafil (POM): generally around 2 to 6 pounds per tablet depending on dose.
- Avanafil (POM, Spedra): often in the 4 to 10 pounds per tablet range depending on strength.
- Non-oral options: alprostadil injections (Caverject), urethral suppositories (Muse) or topical creams (Vitaros) are available for selected patients and typically cost more per dose than oral tablets.
- Non-drug additional a backup options: vacuum erection devices, counselling or psychosexual therapy, and lifestyle measures can also be effective and are often used alone or combined with medication.

Unlicensed products marketed online as Kamagra are not authorised by the MHRA in the UK. They may be offered at very low apparent unit prices (for example, 1 to 3

pounds per tablet), but such purchases carry significant safety and legal risks. Importation of unlicensed medicines can lead to seizure by border authorities and personal import does not guarantee safety or legality. Use licensed UK products supplied by GPhC-registered pharmacies and where needed under prescriber oversight.

Quick comparison notes:

- Onset: avanafil and sildenafil commonly act within 30 to 60 minutes; vardenafil is similar. Tadalafil can act within 30 to 120 minutes but has a longer effective window.
- Duration: tadalafil has the longest duration (up to 36 hours), sildenafil and vardenafil usually last 4 to 6 hours; avanafil around 6 hours.
- Food people relating to one another: high-fat meals delay sildenafil and vardenafil more noticeably than avanafil or tadalafil.

For legal purchasing guidance, see [Law status of the United Kingdom](#).

How to buy given A legal status under UK law

- Regulatory position: products labelled as Kamagra sold online are not licensed by the Medicines and Healthcare products Regulatory Agency (MHRA) and are not legally marketable in the UK.
- Prescription and sale: licensed sildenafil in the UK is a Prescription Only Medicine (POM) for most strengths. A pharmacy-only product, Viagra Connect 50 mg, is available without a prescription after a pharmacist consult for eligible adults aged 18 and over.
- Importation risks: unlicensed ED medications ordered from overseas may be detained by UK Border Force or MHRA. Personal importation does not make an unlicensed product legal or safe.
- Where to obtain: buy from a General Pharmaceutical Council (GPhC) registered pharmacy, whether on the high street or an accredited online service. Legitimate online pharmacies will display GPhC registration and offer UK-based clinical oversight.
- Medical safety: seek medical advice if you have significant cardiovascular disease, recent stroke or heart attack, low blood pressure, or if you take nitrates or interacting medicines.

For safe choice another options and costs, see [Price guide for broadened options](#).

Use in athletic contexts

Sildenafil is not currently listed as a prohibited substance by the World Anti-Doping Agency (WADA). Athletes should confirm the latest rules for their sport and speak with a team physician. Erectile dysfunction medicines are not performance-enhancing drugs for athletic training and should only be used when medically indicated. If treatment is required for a legitimate medical condition an athlete may need to follow Therapeutic Use Exemption procedures.

Frequently raised questions

Could alcohol be unsafe with sildenafil?

Light to moderate alcohol consumption may be tolerated, but alcohol can worsen dizziness, lower blood pressure and blunt erectile response. It is usually safer to limit alcohol when taking sildenafil. See [Amount to take and directions](#) for more advice.

What if the initial sildenafil dose is ineffective?

One unsuccessful attempt does not necessarily mean the treatment is ineffective. Try on several occasions, ensure adequate sexual stimulation, avoid a large fatty meal beforehand and discuss dose adjustment or a different route remedies with your clinician if there is little or no benefit. See [Further options](#).

Can I take sildenafil with other erectile dysfunction pills?

No. Refrain from combining sildenafil with other PDE5 inhibitors or other ED treatments on the same day unless specifically instructed by a prescriber because of increased risk of adverse reactions. Review [Drug interactive engagement risk advisories](#) and [Cases where treatment is not appropriate](#).

Is Kamagra identical to Viagra?

Both may contain sildenafil, but Kamagra products offered online are generally unlicensed in the UK together with therefore do not meet MHRA quality assurance. Only licensed products such as Viagra Connect or UK-licensed generic sildenafil should be used for guaranteed quality and legal compliance. See [Juridical standing in the United Kingdom](#).
